OVERVIEW

Kaunsa plugin kya karta hai

#	PLUGIN	KAAM	INSTALL
1	**OmniRoute**	AI gateway — Claude Code ko bahut saare (free tier wale) models se route karta hai, limit khatam ho to next pe switch	`npm i -g omniroute`
2	**Headroom**	Tumhare aur Claude Code ke beech context/prompt compress karta hai → kam tokens	`pip install "headroom-ai[all]"`
3	**Claude Mem**	Long-term memory — har session mein context dobara explain nahi karna	`npx claude-mem install`
4	**Claude Code Setup**	Anthropic ka official plugin — codebase padh ke skills, MCP, sub-agents, hooks suggest karta hai	`/plugin install`
5	**Task Observer**	Tumhara kaam observe karta hai, repeated kaam/galtiyan note karke skills banane/sudhaarne ke suggestions	`npx skills add …`

Pehle ye ready rakho

- ✓ **Claude Code** installed (terminal mein `claude` chalta ho)
- ✓ **Node.js 18+** (OmniRoute, Claude Mem, Task Observer ke liye)
- ✓ **Python 3.10+** (Headroom ke liye)
- ✓ Shortcut: har plugin ka GitHub link Claude Code mein paste karke bolo *"install this and verify it works"* — Claude khud kar dega.

> Ye sab independent open-source projects hain (sirf #4 Anthropic ka official hai). Install se pehle har project ka README padh lo — commands update ho sakti hain.

PLUGIN 1

OmniRoute

01

Ek local **AI gateway**. Tum apne providers (bahut saare free tier wale bhi) connect karte ho, aur OmniRoute Claude Code ki requests unke beech route karta hai. Ek model ki limit ya error aaye to **agle healthy model pe fallback** — isliye kaam rukta nahi. GitHub: `diegosouzapw/OmniRoute`

Install + start

```
npm install -g omniroute
omniroute                    # gateway + dashboard start
```

1. Browser mein dashboard kholo: `http://localhost:20128`
2. Dashboard mein apne providers / free tiers connect karo (har provider ka apna free plan aur key hota hai).
3. Claude Code ko OmniRoute ke through chalao:

```
omniroute run claude --model auto      # "auto" = connected providers se combo
omniroute run claude --model auto --dry-run   # pehle preview dekho
```

> **Honest note:** "Unlimited" ka matlab hai bahut saare free tiers ke beech switch hona — har provider ki apni limit aur terms hain. Ye Claude ke paid models free nahi karta. Fresh install pe pehle kam se kam ek provider connect karna padta hai, warna `auto` ke paas route nahi hota.

02

PLUGIN 2

Headroom

Ek **context compression layer**. Ye tumhare aur Claude Code ke beech baith ke lambe tool outputs, search results aur context ko compress karta hai, taaki model ko kam tokens bhejne padein. Original data local save rehta hai — model ko zaroorat ho to wapas maang sakta hai.

Install (Python 3.10+)

```
pip install "headroom-ai[all]"
```

Claude Code ke saath chalao

```
headroom wrap claude            # Claude Code ko Headroom ke through start karta hai
```

Kahan sabse zyada fayda

- ✓ Bade codebase mein search / exploration
- ✓ Lambe logs, test outputs, file listings
- ✓ Lambe sessions jahan context bhar jaata hai

> Token savings har kaam pe alag hoti hain. Project jo bade numbers batata hai (jaise 90%+) woh unke apne benchmarks hain — apne project pe khud compare karo.

PLUGIN 3

Claude Mem

03

Claude Code ko **long-term memory** deta hai. Har session mein jo kaam hua uska summary save hota hai aur agle session mein relevant cheezein automatically yaad aa jaati hain — baar-baar project samjhane ka jhanjhat khatam. GitHub: `thedotmack/claude-mem`

Install (recommended)

```
npx claude-mem install
```

Ya Claude Code ke andar (plugin marketplace)

```
/plugin marketplace add thedotmack/claude-mem
/plugin install claude-mem          # phir Claude Code restart
```

- ✓ Check: terminal mein `claude plugin list` — claude-mem dikhna chahiye
- ✓ Memory viewer: browser mein `http://localhost:37777`
- ✓ Requirements: Node.js 18+, Claude Code (Bun khud install ho jaata hai)

> `npm install -g claude-mem` mat karna — usse sirf library aati hai, plugin hooks register nahi hote. Claude Code ki apni built-in memory bhi on reh sakti hai, to do memory systems ho sakte hain.

PLUGIN 4

Claude Code Setup

Anthropic ka **official** plugin. Ye tumhara poora codebase padhta hai aur batata hai ki is project ke liye kaun si **skills, MCP servers, sub-agents aur hooks** sabse useful honge. Ye sirf suggest karta hai — tumhari files khud nahi badalta.

Install (Claude Code ke andar)

```
/plugin install claude-code-setup@claude-plugins-official
```

Use karo

```
> recommend automations for this project
```

[SKILL]
jaise code review, testing, docs

[MCP]
jaise GitHub, database, browser

[SUB-AGENT]
jaise test runner, debugger

> Tip: suggestions mein se ek-ek karke install karo aur har ek ke baad kaam test karo — sab ek saath on karne se Claude confuse ho sakta hai.

PLUGIN 5

Task Observer

05

Ek "meta-skill" (by rebelytics). Kaam ke dauraan ye background mein note karta hai — kahan dikkat aayi, kaunsa kaam baar-baar ho raha hai, kaunsi galti repeat hui. Phir review mein in observations se **nayi skills banane ya purani skills sudhaarne** ke suggestions deta hai.

Install

```
npx skills add https://github.com/rebelytics/one-skill-to-rule-them-all --skill task-observer
```

Ya manually: skill folder ko `.claude/skills/task-observer/` (project) mein copy karo.

Har session mein active rakho

Project ki `CLAUDE.md` file mein ye line add karo:

```
At the start of every session, load the task-observer skill.
```

> Ye skill files ko khud edit nahi karta — pehle observations log karta hai, aur changes tum review karke approve karte ho. Repo naam check karo (rebelytics) — milte-julte naam ke doosre skills bhi hain.

DONE! ✓

Ab Claude Code 5x smarter hai
